Patient Name:

Case Number:

Species: Feline

Breed: Domestic Shorthair

Age: 10 yrs 9 months

Sex: FS

Imaging modalities: Radiology

Date Study Occurred: January 5, 2007

Number of Images Sent: 2

Date Sent: January 5, 2007

Wt.: 6.6 lbs/2.9 kgs

Temp.: 100.2 F/37.8 C

Pulse: 180/min

Case History:

Weight loss of 2 1/2 lbs in 2 months. PU/PD. Nauseated, inappetant.

Description:

N/A

Findings:

Radiographs of the thorax/abdomen were obtained. In the thorax, no abnormalities are seen. The cardiac size and shape and pulmonary vessels are normal. In the abdomen, the kidneys are ill-defined, appear to be small and are misshapened. The colon contains a large amount of gas. The stomach and small bowel are minimally distended with fluid and gas. There is a lack of detail throughout the abdomen compatible with emaciation. No definitive evidence of an abdominal mass is seen. Several sites of spondylosis are present in the spine.

Assessment:

Normal thorax. The small misshapened kidneys are consistent with idiopathic chronic renal disease. No other definitive abnormalities are seen in the abdomen. Considerations would still be given to fatty liver disease.

colangiohepatitis or infiltrative bowel disease. Atypical hyperthyroidism should also be considered. An ultrasound examination of the abdomen may prove helpful with careful evaluation of the liver and kidneys.
